Micro-organisms in Compressed Air

Untreated, compressed air entering a wet air receiver and/or distribution piping system will contain many contaminants, including liquid water, water aerosols and it will also be 100% saturated with water vapor.

Water is the most problematic of all compressed air contaminants as it not only causes damage through corrosion, more seriously; wet compressed air promotes the growth of micro-organisms.

Microbiological Contamination in Your Compressed Air Can:

- Potentially harm the consumer
- Diminish product quality, rendering unfit for use
- Lead to a product recall
- Cause legal action against a company
- Damage a manufacturers brand

Are Your Employees at Risk?

Compressed air is used widely in general industry and untreated compressed air exhausted from pneumatic tools, valves, cylinder or machinery will also contain micro-organisms. If this exhausted air is inhaled by employees working in the vicinity or using tools / machinery it can also lead to excessive work force illness.

Learn How to Take Control. Download the White Paper Now.
